

Yale University Selects zTrace to Provide Laptop Protection to Students

Boston, MA, August 20, 2003 - zTrace Technologies announces its partnership with Yale University to provide zTrace Gold and zControl, its laptop tracking, recovery and data protection products, to Yale students in a joint effort to reduce computer theft. Students will be able to purchase zTrace Gold and zControl products and services through a custom zTrace website designed for Yale as well as through the Office of Security Education at Yale University.

A computer running the stealth-mode zTrace Gold completes a virtual handshake with the zTrace server every time the computer's owner connects to the Internet. If that computer is stolen or lost, the owner reports it missing and puts the server on alert. The next time that the computer is used to make a connection to the Internet, zTrace Gold is able to pinpoint the computer's exact location so that authorities are able to recover and return it.

"The convenient aspect of zTrace Gold is that it allows Yale to manage the tracking and recovery process internally through its own security department and local law enforcement agencies," says Alexander Kesler, Founder and President of zTrace Technologies. "This guarantees students that their lost computer will be recovered in the quickest time possible, which is what zTrace Gold is all about."

With zControl, students can feel confident that the data will be protected from the eyes of the thief or intruder and be returned to them. zControl is stealth software that provides remote but invisible control of the data that is stored on the missing computer. Through zControl, students will be able to remotely encrypt, delete, and recover specified files from their computers in case of loss or theft as well as render the computer useless by remotely locking all its functions. zControl is therefore able to remotely control the visibility and access to a student's files as well as the computer itself.

"Students are just as dependent on their computers and their files as businesspeople are. In addition, students bring their laptop computers with them everywhere which can lead to more opportunity for laptop theft," states Susan Daria Burhans, Security Educator of Yale University. "We believe that making zTrace products available to our students will make everyone involved feel more secure-students, parents, and Yale University administrators."

About zTrace Technologies

zTrace Technologies is a premier provider of innovative security software and services designed to meet the challenging data security and asset protection demands of today's mobile computing environment. Serving enterprise, government, education, and consumer markets, zTrace is fast-tracked to be the global leader in mobile computing security. For more information about zTrace products, visit <http://www.zTrace.com> or call (877) zTrace2.
